Book Review

The Encyclopedia of Visual Medicine Series
An Atlas of Diabetes Mellitus
Second Edition
Ian N Scobie

In the four years since the first edition of the Atlas of Diabetes, there have been remarkable developments in the diagnosis, treatment and management of diabetes. Diabetes mellitus has an impact on all medical specialities. No practising physician can afford not to have at least a basic knowledge of this immensely important public health program that affects so many people. Diabetes is the paradigm of a condition that necessitates a multidisciplinary approach to its management and treatment. General practitioners, physicians, surgeons, nurses, dietitians, chiropodists, psychiatrists and ophthalmologists are all drawn into the process. In addition, medical students and postgraduate doctors must learn about diabetes and its protean manifestations.

Concentrating on the practical management of diabetes, Dr. Ian Scobie has reviewed these massive changes - from the use of continuous blood glucose monitoring (allowing the patient a better quality of life via the use of a device that can instantly recognize abnormal blood sugar levels) to the vast number of new medications and treatment regimens.

The text of this second edition has been completely revised to capitalize on the huge number of developments in this branch of medicine, with many new and interesting figures designed to help the primary care physician and endocrinologist visualize the common manifestations of this disease.

This book attempts to provide a clinical and scientific background to the diagnosis, clinical presentations and treatment of diabetes mellitus. A further aim of this volume is to portray the wide and varied expressions of diabetes and its complications as an aid to their more ready recognition in clinical practice. This atlas should therefore be of an interest to all those who are involved in the provision of diabetic healthcare.

Book Review

Care of The Medical Outpatient

Prof. G Lakshmipathi

The book deals specifically with management of adult patients presenting with medical problems, and strictly at the Outpatient level. It is well known that the majority of cases presenting at a practitioner's clinic need only management as an outpatient calling for a rapid and definitive diagnosis, drug therapy as applicable (keeping in mind their adverse reactions, interactions, and their usage in the particular patient), general advice relating to the particular sickness, a schedule for review, and referral to a specialist when indicated. This book addresses all these aspects in detail in most practicable terms. For a quick grasp of a complex situation, the management of the commoner diseases is presented in form of algorithms. Uncommon and obscure diseases and those managed and supervised solely by specialists, and serious conditions needing only inpatient care are not discussed, as this is not the purpose of the book.

The book also has some useful and unique chapters on the art of modern medical practice as well as a host of useful tables and columns of great utility in the daily practice of a busy practitioner. I have included a large numbers of medical quotations, relevant to each subject, hopefully to invite the user to browse deeper into the chapter.

Basically it is a ready reckoner for a busy doctor, who would like to give the most recent and approved modality of therapy for his/her patients in quick time without having to rummage through a lot of textual prose.

To the best of our knowledge, there is not another book of this kind published in India for the Indian practitioner.

Book Review

National Series
Recent Advances in Medicine - II
1st Edition
PS Shankar

Medicine is a life-long learning process. The physician maintains a desire to acquire new knowledge pertaining to new diseases, newer manifestations of known diseases, newer investigations and diagnostic procedures, newer modalities of treatment and its application to patient care. The physician has to constantly update himself and widen his scientific base.

Medicine has made tremendous advance in the last two centuries. Physician has ‘a commitment in the highest standards of excellence in the practice of Medicine and in the generation and dissemination of knowledge’.

An attempt has been made in this book to present and discuss 26 current issues facing the physicians over the globe. The diverse issue discussed here are of topical interest such as Global warming, Doping, Bioterrorism, Genome, SARS, Burn-out syndrome, MDR-Tuberculosis, Cardiac imaging and other subjects, which I am sure will give an initiative to the postgraduates and physicians to expand their understanding of newer developments in medical science.
